AWAKENING EDEN - THE LIVING LIBRARY

Welcome home, fellow gardener

Awakening Regeneration

The guide we wish someone had given us before we planted our first garden.

LIVING GUIDE 01 - ABOUT 18 MINUTES - FREE FOREVER

A heart-centred beginning into regenerative interbeing, living soil, syntropic thinking, food forests, water wisdom and practical ways to help life flourish.

By Benjy and Sofia

A small letter before we begin

This is an invitation, not another thing to perfect.

Regeneration begins wherever care becomes relationship.

You do not need a farm, a perfect plan or endless energy. You can begin with a balcony pot, a bare patch of soil, a bowl for compost, a conversation with a neighbour or ten quiet minutes beneath a tree.

We created this companion to gather foundations we wish we had understood earlier: soil is alive, water wants to slow and sink, diversity creates resilience, and our own wellbeing belongs inside the circle of care.

Take what nourishes you. Question what asks to be questioned. Let one paragraph become one living action.

How to walk with this guide

1. **Read one chapter.** Let one idea truly land.
2. **Try one practice.** Small and real is beautiful.
3. **Take one living action.** Let learning enter your hands.
4. **Return when you are ready.** Nature never hurries, yet everything grows.

One seed. One relationship. One living step.

Chapter one - The seed

Find your why

Before asking what to plant, ask what you want your life to nourish.

Perhaps your heart hurts when you see degraded land, lonely communities or food systems that no longer feed life. Perhaps you are searching for resilience in changing times. Perhaps you simply remember that another way of living is possible.

A clear why grows deeper roots than motivation. It helps a small act - saving seeds, covering soil, sharing food - become part of a future you can feel and participate in.

Field note

Hope is not waiting for someone else to repair the world. Hope becomes sturdy when it has hands, neighbours, roots and a next step.

One living action
Sit outside for ten minutes. Ask: **What kind of world do I want my daily actions to feed?** Write one sentence and keep it somewhere visible.

Chapter two - The roots

Regenerative interbeing

Our wellbeing is inseparable from the wellbeing of the living world.

Healthy soil supports healthy plants. Healthy plants support insects, birds, animals and people. Communities flourish through trust, generosity and shared care. Our inner lives and our outer actions continuously shape one another.

Regeneration is not only restoring landscapes. It is restoring relationship: with ourselves, each other, food, water, soil, community and future generations.

Regeneration includes the regenerators

Rest, laughter, boundaries and receiving care belong inside the work. We are not asked to burn ourselves out.

One living action
Choose one meal today. Pause before eating and name three relationships that made it possible: soil, water, seed, farmer, pollinator, cook, sun or rain.

Chapter three - Nature's pattern language

What life keeps teaching

Patterns we can observe in forests, gardens and communities - invitations to design with life instead of against it.

01

Diversity creates resilience

Flowers, herbs, fungi, insects, support species, food plants and trees make a living system stronger together.

02

Cover and feed the soil

Mulch is blanket, armour and food. Leaves, compost and chop-and-drop biomass protect the life below.

03

Slow, spread and sink water

Read the slope. Help rain enter soil where it can recharge life and build resilience.

04

Think in layers

Canopy, understory, shrubs, herbs, roots, groundcovers, climbers and fungi share light, space and time.

05

Work with succession

Pioneers prepare the way. Fast species make biomass. Long-lived plants inherit a richer future.

06

Observe before acting

Sun, wind, water, soil, wildlife and human needs are already speaking. Good design begins by listening.

One living action
Walk slowly around your home or garden. Notice one place where water runs, one place where life gathers and one edge that could become more abundant.

Chapter four - The living ground

Soil is not dirt

Soil is a living community - minerals, roots, fungi, bacteria, air, water and countless tiny beings.

Healthy soil holds water, cycles nutrients, stores carbon and supports resilient plants. The fastest first step is often not buying more products, but protecting the soil and feeding its biology.

- Keep soil covered with mulch, leaves, straw, wood chips or living plants.
- Add compost and varied organic matter.
- Keep living roots in the ground as much as possible.
- Reduce unnecessary disturbance and compaction.
- Invite fungi with woody material, perennial plants and patience.

Field note

A handful of healthy soil is not inert material. It is a neighbourhood. Feed the relationships and fertility follows.

One living action
Find one patch of bare soil and cover it with organic matter. Leave a little breathing space around plant stems.

Pause and go outside

Put the guide down for five minutes. Feel the air. Notice the smallest living being you can find. Ask what this place needs - and listen before answering.

Chapter five - Hands into life

Regenerate one corner

A small, carefully tended corner can teach more than a grand plan made without relationship.

1

Observe

Where does water flow? Where is morning sun or harsh afternoon heat? What already thrives after rain?

2

Feed

Layer leaves, compost, safe woody material, green cuttings and mulch to begin building a living sponge.

3

Plant diversity

Choose climate-suited herbs, flowers, groundcovers, support species, shrubs and trees that can help one another.

One living action
Choose one square metre, container or tree circle. Photograph it, observe it and begin with soil cover today.

Chapter six - Where life gathers

Benjy's Abundant Edge

Edges are meeting places. Water slows. Roots overlap. Biomass collects. Fungi spread. Diversity increases.

Abundant Edge is Benjy's evolving pattern for creating fertile planting lines and tree connections with locally appropriate materials: woody matter, charged biochar where suitable, compost, green cuttings, mulch and carefully designed water-holding contours or raised edges.

A gentle pattern:
1. Read contour and water movement.
2. Choose an appropriate, safe edge.
3. Add varied organic matter.
4. Use properly charged biochar thoughtfully if suitable.
5. Plant climate-wise diversity.
6. Mulch, monitor and feed with chop-and-drop.

Design with care

Earthworks and water-retention structures are site-specific. Read the landscape, soils, safe overflow and legal context. Seek experienced help for consequential work.

One living action
Map one existing edge: a path, fence, contour, roof drip line or tree circle. Notice how water, wind, shade and organic matter behave there.

Chapter seven - Life tending toward life

Syntropic thinking

Syntropy invites us to design with life's tendency to build complexity, cooperation and abundance over time.

In syntropic agroforestry, plants are arranged through space and succession. Fast-growing species create biomass, shade and protection. Timely pruning stimulates growth and feeds the soil. Each phase prepares conditions for what can come next.

The lesson is larger than farming: a living system flourishes when each part can contribute to the greater whole.

Field note

A support plant's life continues as shade, mulch, fungal food, soil structure and protection for the next generation.

One living action
Pair one fast-growing support species with a slower, long-lived plant suited to your climate. Imagine how future pruning can feed the soil.

Chapter eight - Belonging to place

Mediterranean regeneration

Regeneration is not copying a tropical food forest everywhere. It is helping each landscape become more alive in its own character.

Mediterranean lands ask us to work with wet winters, dry summers, intense sun, fire and fragile water cycles. Shade, soil cover, organic matter, infiltration, wind protection and climate-suited diversity become essential.

Water is a relationship

Thoughtful water-retention design can rehydrate soils and support aquifer recharge, but every site has limits. Work from observation, contour, rainfall, soil and safe overflow.

One living action
During the next rain, watch where water comes from, where it speeds up, where it pools and where it leaves. Make notes before making changes.

A note from Benjy and Sofia

We are students before we are teachers.

This guide grew from years of gardens, mistakes, retreats, circles, questions, teachers, tears, laughter and the quiet wonder of watching life return.

Australia shaped us deeply. So did Colombia, Portugal and every landscape, farmer, friend and community that welcomed us. We carry gratitude for the teachers and Original Peoples who helped us feel a deeper belonging to land, while recognising the continuing pain, courage and living movements of Indigenous communities.

We share this imperfectly, with love - not as the final answer, but as one seed in a much larger forest of wisdom.

With love, Benjy and Sofia

Gratitude and lineage

No wisdom grows alone. This companion lives within a wider lineage: Indigenous land care, permaculture, syntropic agroforestry, regenerative agriculture, ecology, community practice and countless people learning directly from place.

Our heartfelt gratitude includes Gabu Damien of the Warrungu people in Far North Queensland; Bec Bop, Adam Collins and Watty; our PDC teachers and the Crystal Waters community; Jay Jackson, Analiese Horden, Brother Beans and Sustainable Barefoot Design; Charles Eisenstein; Sacred Earth tribe and foundation; the farmers, gardeners, retreat keepers, earth lovers and community leaders whose generosity continues to travel through us.

Names and teachings are shared with reverence, not as endorsements. Cultural knowledge belongs to its custodians. We will keep correcting, crediting and deepening this living guide as permissions and details are confirmed.

Reciprocity keeps wisdom alive

Credit the teachers. Honour the custodians. Ask permission before sharing cultural knowledge. Give back where you have received. Let gratitude become relationship rather than decoration.

One living action

Name someone, somewhere or something that taught you how to care. Thank them if you can. Let gratitude become reciprocity.

Before you go...

Every forest began as one small seed.

May your inner garden flourish. May the gardens you create nourish others. May we leave this Earth, together, a little more alive than we found it.
